

# MAKING UNDERGROUND INFRASTRUCTURE SAFER

Facilitating a System For Residents That Promotes Safe Digging

Previously, numerous initiatives were taken to prevent damage occurring to underground infrastructure while digging. They successfully lowered the number of annual hits by 80%, but later became stagnant especially for residents. To continue innovating successful damage prevention initiatives, the human centred design approach was taken to generate solutions to enhance the level of safety while residents dig around their houses.

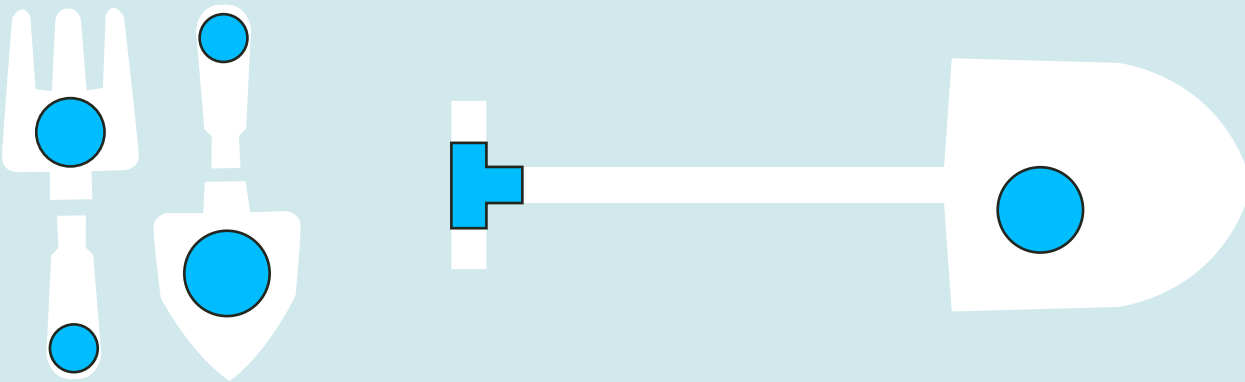

## How do we solve this?

### Awareness Stickers System

**Why?** Currently there isn't an effective way of informing residents of their legal duties prior to digging.

**How?** On digging tools at rentals & retailers, & meter boxes

**Benefits**

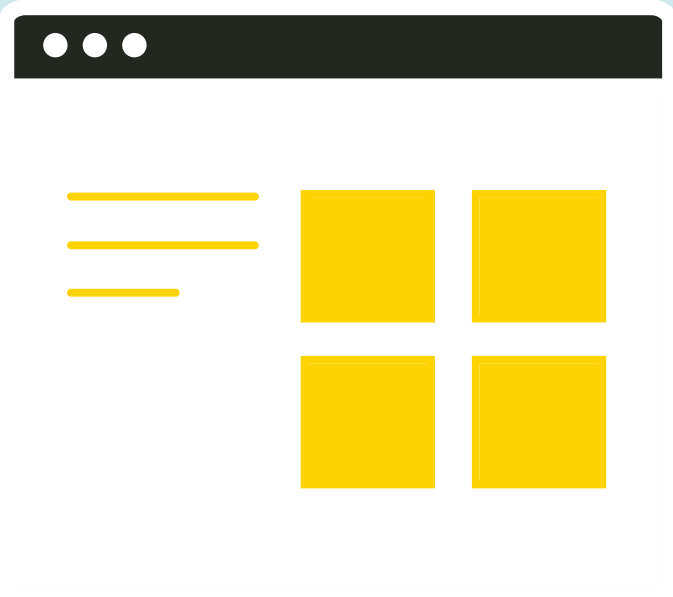

Manufacturers get an improved sense of reputation for complying with safe digging procedures, which would increase sales

Union Gas' pipes become safer

Retailers/Rental stores promote their tools & promotions on ON1Call attracting more customers

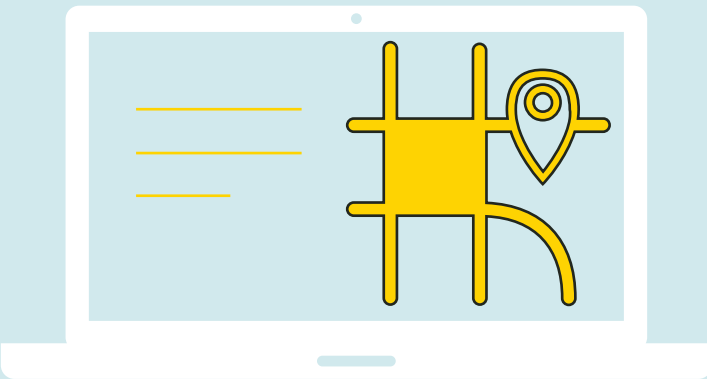

Residents become aware of calling before digging

### ON1Call Website Redesign

**Why?** Currently ON1Call website isn't very user friendly, especially for residents.

**How?** A request process will require only 3 clicks, & is integrated with an interactive map

**Benefits**

More locates mean fewer pipe hits and thus lower costs

User-friendly interface removes any barriers to request a locate. Thus greater safety for residents digging

To ON1Call, this means more locates requests from residents. Thus greater safety for residents and utility companies like Union Gas
